Allowance

ALLOWED CLAIMS

Claims 29-65 are allowed.

REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

The instant claims are drawn to a fluid distribution module that acts as a degassing device for the removal of air from blood from an extracorporeal blood circuit. The device comprises a first chamber having a fluid inlet for receiving blood and a second chamber having a lid with a vent disposed therein and a fluid outlet for discharging blood. The vent is closed by a hydrophobic membrane, such that air is allowed to be removed from the system while blood is prevented from being removed. Specifically, the hydrophobic membrane is configured such that it is allowed to deform under pressure *until the membrane contacts the top wall of the lid*. The first and second chambers are arranged such that the first chamber partially extends within the second chamber and communicated therewith via an upper passageway. The second chamber comprises an upstream portion that extends above the passageway and a downstream portion extending below the passageway, as demonstrated in applicant's Figures 5 and 6. The degassing device is connected to the extracorporeal circuit such that a first conduit feeds blood from a treatment device into the first chamber, and a second

conduit receives blood from the second chamber and returns it to the extracorporeal circuit.

The closest prior art of record is Lindsay et al. (US 4,433,971), which teaches an integrated bubble trap apparatus for use with an extracorporeal circuit. The apparatus comprises a first chamber 206 having a fluid inlet, a second chamber (208, 210) having a lid portion 186 with a vent 188 disposed thereon and a fluid outlet 62 at the bottom portion of the container. The first chamber extends partially within the second chamber and communicates therewith via an upper passageway 204. Lindsay, however, does not teach a hydrophobic membrane disposed within the vent such that the membrane is capable of deforming under pressure until the membrane contacts a top wall of the lid. Specifically, Lindsay teaches a separate filter means 194 is disposed at the top of a vent tube 190 (as shown in Figure 1). Lindsay, therefore, neither teaches nor suggests a flexible filter membrane as claimed.

Verkaart (US 5,707,431) also teaches a similar device, wherein the vent opening comprises a lid portion having a hydrophobic filter membrane disposed therein. Verkaart's system, however, requires a set of rigid structural elements *that keep the filter membrane separated from the top wall of the lid* (see Figure 2 and Column 3, Lines 34-39). This configuration allows air to be sucked through a series of holes 26 in the cap, such that a valve 22 in the lid is only opened when there is a sufficiently high pressure buildup above the filter. This system therefore functions inherently differently than one wherein the filter membrane is allowed to move in response to pressure differentials (see Column 2, Line 49 through Column 3, Line 39). Specifically, *modifying*

Verkaart's device to allow the filter membrane to flex in response to pressure differentials would destroy the functionality of Verkaart's device because it would make the pressure-sensitive valve system within the vent cap inoperable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
